

Websyidian Web Developer+ The Web Client for Plex

Direct Web Deployment for Plex

ADC Austin and Websyidian are pleased to announce Websyidian Web Developer+, the Web Client for Plex that makes direct HTML deployment possible for Plex development shops. Plex developers can use WWD+ to deploy existing applications and to create new applications in a standard J2EE web server environment.

Fast and easy start up – seamless deployment

Getting started with WWD+ is easy – you don't need to modify typical Plex functions to deploy to the Web. Simply regenerate and publish in one seamless step. Furthermore, advanced patterns are available to perform sophisticated HTML templating, and to integrate with web services and features like mapping software or JavaScript.

Key Features:

- WYSIWYG HTML generated directly from the Plex panel layout
- Use existing action diagram code without modification
- Integrates with Websyidian and other web based applications
- Produces secure, robust, and scalable applications
- Supports 2E applications migrated to Plex via ADC Modernization Studio.
- Deploy on any J2EE web/application server such as IBM Websphere and Tomcat.
- Advanced HTML templating capability available for sophisticated web applications

Free trial and more information

WWD+ will be available December 2007 through Websyidian, ADC Austin and a network of CA partners worldwide. For more information, a demonstration or a free trial version, please contact ADC Austin or Websyidian.
